

Project Title: Sales Summary Dashboard – Celebal Internship Project

Prepared By: Tushar (MCA Student, Celebal Excellence Internship)

Date: August 2026

1. Introduction

This project demonstrates the creation of a **Sales Summary Dashboard** using Microsoft Power BI. The dashboard analyzes product sales data stored in the **Gold layer of Azure Data Lake Storage Gen2 (ADLS Gen2)**.

The goal is to provide clear insights into product performance, including total units sold and revenue, to support better business decisions.

2. Methodology

- **Data Source:** Parquet files in ADLS Gen2 (gold/sales_summary).
- **Problem Faced:** Power BI's folder connector did not properly recognize Parquet format, causing metadata issues.
- **Solution Implemented:**
 - Used **Azure Synapse Analytics** to create an external table over the Parquet files.
 - Exposed the table via a **SQL endpoint**.
 - Connected Power BI to the SQL endpoint for clean column recognition.
- **Tools Used:** Azure Synapse, Power BI Desktop.
- **Dashboard Components:** KPI card, bar chart, and product sales table.

3. Dashboard Screenshots

Figure 1: Sales Summary Dashboard (Main Layout)

Figure 2: KPI Card – Total Units Sold

Figure 3: Product Sales Table

4. Analysis & Insights

- **Product C** generated the highest revenue, showing strong demand.
- **Total Units Sold** increased by **8.2%**, indicating positive growth.
- **Product E** underperformed compared to others, suggesting improvement opportunities.

- The dashboard highlights both strengths and weaknesses, enabling better strategic planning.

5. Conclusion

The Sales Summary Dashboard successfully integrates **Power BI** with **Azure Synapse** to visualize Parquet data. It provides actionable insights into product performance and overall sales trends. Future scope includes connecting live data streams, adding KPIs such as profit margins, and integrating predictive analytics.
